

Grant Agreement Number: 723833		
Project Title: ENgineering COMPASS		
Project Acronym: ENCOMPASS	Duration: 1 st October 2016 – 30 September 2019	
Date: 31/12/2016	Project Website Address: www.encompass-am.eu	
EC Project Officer: Christoph HELMRATH	Email: Christoph.HELMRATH@ec.europa.eu	
Work Package Number:	Deliverable Number: 7.4	
Deliverable Name: General Press Release Available to all partners for dissemination to 3rd parties.		
Date of Delivery: 31 st December 2016	Actual	16 th January 2017
Status	Draft <input type="checkbox"/>	Final <input checked="" type="checkbox"/>
Nature	Prototype <input type="checkbox"/>	Report <input checked="" type="checkbox"/>
	Specification <input type="checkbox"/>	Tool <input type="checkbox"/>
	Other <input type="checkbox"/>	
Distribution Type	Public <input checked="" type="checkbox"/> Restricted <input type="checkbox"/> Consortium <input checked="" type="checkbox"/>	
Authoring Partner: EWF		
Contact Person: Eurico Assunção and Rita Bola		
Email: EGAssuncao@ewf.be rgbola@ewf.be	Phone	Fax
Abstract (for dissemination)	n/a	
Keywords	n/a	
Name of the Scientific Representative of the Project's Co-ordinator, Title and Organisation:	Name: Dr David Brackett Tel: +44 (0)2476 647331 E-mail: David.Brackett@the-mtc.org	

This project has received funding from the European Union's Horizon 2020 research programme under grant agreement No. H2020-FOF-2016-723833-ENCOMPASS

1	Introduction.....	2
2	Press Release	2

1 Introduction

This deliverable contains the project press release. The aim of this report is to present the press release that will be used to disseminate the project objectives through a wider audience. The consortium will look for opportunities to use it either in generic journals or journals from the sector.

This press release can be used by all the partners from the consortium and can be adapted for different situations if needed. This is the first version of it, it will be updated as the project starts to show tangible results. In the end of the project, a new press release will be prepared in order to disseminate the results instead of the objectives.

2 Press Release

ENCOMPASS strengthens Europe's leading position in metal additive manufacturing

ENCOMPASS is a three-year project that aims to significantly improve the overall productivity of the laser based metal powder bed fusion technology process chain, principally through the creation of an integrated design decision support (IDDS) system.

Additive manufacturing (AM), often referred to as 3D printing, has significant potential to enable novel products with improved performance, improved material efficiency, reduced environmental footprint and reduced production costs. Commercial metal AM machines have been available for many years, and the interest from industry for the adoption of this technology for production of end parts is steadily increasing. However, for these technologies to be widely adopted by industry as a viable production method, process chain productivity needs to be significantly improved. The specific category of metal AM that stands at the heart of the ENCOMPASS project is laser powder bed fusion (L-PBF), where metal powder is fused together to form solid material by means of a laser based energy source.

Whilst metal AM is used for prototyping and has begun to penetrate some smaller markets, it is not yet entirely competitive on a larger scale, especially with respect to production speed and costs. Where metal AM is being used, the current state of the process chain is typified by non-integrated process stages dependent on the knowledge of experts for appropriate decision making. In order to increase the productivity of the process chain and to bring it a significant step further towards industrial manufacturing, a better mastering of all stages of the process chain and their interaction is necessary. Although metal AM is highly flexible, the change from one production lot to the next usually requires

operator intervention and time to optimize new build files and processing strategies. The trend towards mass customization of products requires a high degree of digitization as well as tools and systems that are highly autonomous and automated to reduce production time and costs.

The three key overall challenges to industrial exploitation of metal AM can be summarized as: 1. Time and cost for manufacture of components through the whole process chain; 2. Time and cost to get from component design to production 3. Reliability and robustness of the process. To address these challenges, the overall aim of the ENCOMPASS project is to create an integrated design decision support (IDDS) system for the whole L-PBF process chain to flexibly optimize the exploitation of metal AM.

The three key process chain steps tackled in the ENCOMPASS project are: the component design process, the L-PBF build process itself, and the post-build processes (including post-processing and inspection). The integration at digital level enables numerous synergies between these steps and in addition, the steps themselves are being optimized to improve the capability and efficiency of the overall chain. This will enable a significant reduction in time and cost, and an enhanced level of quality for safety critical parts.

To achieve this a consortium of 11 partners, consisting of companies, research centers, and universities involved in AM, has teamed up to deliver the ENCOMPASS project. The 3-year project, which started in October 2016, aims to create a system to flexibly optimize the exploitation of metal AM. Rather than focusing efforts only on increasing the productivity of the L-PBF build process itself, ENCOMPASS considers the process chain holistically which will have a direct positive impact on productivity, which will benefit equipment manufacturers, designers, part-component producers and end-users.

To steer the development and enable demonstration of the performance of the IDDS system, test cases from automotive, aerospace and medical industries have been selected. The industry wide adoption of the IDDS system will enable an uptake of L-PBF in a multitude of other sectors. The successful implementation of the ENCOMPASS project will enable a significant reduction in time from 'design to piece', increase the process chain productivity, and reduce cost of production. The solution is envisaged to be under validation mid-2019.
